astro is a nodejs bot for flowdock. Its particularity is its ability to learn new commands.

# CHAPTER 1

---

## Introduction

---

astro is a nodejs bot for flowdock. Its particularity is its ability to learn new commands.

# CHAPTER 2

---

## Installation

---

### Install dependencies

Dependencies are managed through npm

```
npm install
```

### Configure

You have to configure the bot to use your own flowdock API tokens

```
mv config.sample.js config.js  
vim config.js
```

### Basic configuration reference

In order to get your flowdock tokens, go to <https://www.flowdock.com/account/tokens>,

- userToken = Personal API token
- apiToken = Flow API token.

apiToken must match the corresponding flow. You can see that all configuration options reside under the ‘default’ key, it allow you to define multiple configs.

```
var config = {  
  'default': {  
    'botName': 'astro', // name of your bot  
    'org': 'ORGANIZATION_NAME', // flowdock organization name  
    'flow': 'FLOW_NAME', // flowdock flow name  
    'userToken': 'YOUR_FLOW_USER_TOKEN', // flowdock personal API token
```

```
'apiToken': 'YOUR_FLOW_API_TOKEN', // flowdock flow API token
'welcomeMessage': 'Hi, I'm astro' // message to display on bot connection
}
};
```

## Run

You're now ready to launch astro, simply type teh following command in the root folder

```
node astro.js default
```

If you want to run the bot with a different configuration, define it and call

```
node astro.js CONFIG_KEY
```

# CHAPTER 3

---

## Usage

---

Once astro is running, you just have to type a command in flowdock, then, if astro find a matching command, it will process it and send the response in the same flow. For example, if you want to invoke the ‘pt’ command:

```
pt documentation astro
```

Output

```
+-----+  
| 1 documentation point for astro |  
+-----+
```

Commands have an available help, to show it:

```
pt help
```

Output

```
pt help                                         author: astr  
-----  
give a type point to the given user  
usage:  
  pt humor john
```

## Available commands

### List command

The list command display the list of all available commands, to invoke it:

```
list-cmd
```

Sample output

```
astr available commands
-----
• teach ..... astr
• list-cmd ..... astr
• so ..... astr
• pt ..... astr
• relic ..... astr
...
```

## So command

The so command display an image (most of them are animated gifs) according to the given term, example:

```
so crazy
```

Output

```
http://i188.photobucket.com/albums/z284/oblongman7/Scrubs/b6488ee3.gif
```

note: flowdock automatically convert the link to an image.

## Point command

# CHAPTER 4

---

## Tests

---

You can run tests with the following command:

```
./node_modules/.bin/vows tests/*
```
